Nicole Upchurch is an active high school student, playing for her varsity soccer team in Somerset, Ky. But last year she suddenly felt ill and tired and began losing weight. When her mom started making frequent trips to pick Nicole up early from school or soccer practice, they knew something was wrong.

Nicole’s left index finger became swollen, so in September of 2012 she went to an urgent care center near her home. The providers there diagnosed it as a spider bite. The urgent care center prescribed steroids to reduce the swelling. But Nicole’s other symptoms didn’t go away, and the swelling reappeared over her winter break.

She scheduled an appointment with a local orthopaedic surgeon in Somerset who referred her to a hand specialist in Lexington. Doctors thought Nicole might have a cancerous tumor on her finger. They removed the tumor and performed a bone graft where the tumor had worn away part of her bone. A short time later, the tumor was back again.

**Expert diagnosis at UK**

This time, her doctors sent her to Patrick W. O’Donnell, MD, an orthopaedic oncologist recently recruited by UK HealthCare. Dr. O’Donnell is the

“I wholeheartedly believed they knew what they were doing. And they obviously did because it’s working.”

– Nicole Upchurch
only orthopaedic oncologist on staff at any hospital in Central and Eastern Kentucky. He specializes in treating patients with bone tumors.

As an academic medical center, UK HealthCare is often the best choice for patients who have rare or complicated conditions that are difficult to diagnose and treat. Our doctors are able to provide the multidisciplinary, highly specialized care patients need.

Dr. O’Donnell diagnosed Nicole with a giant-cell tumor. Giant-cell tumors are rare and aggressive but non-cancerous. According to the American Academy of Orthopaedic Surgeons, giant-cell tumors occur in about one person per million each year. And it is even more rare to find a giant-cell tumor in a patient younger than 20.

“We have had awesome doctors and nurses. It’s like they’re family now. That’s how we think of them.”

– Nicole’s mom, Tammy Dorsey

“Thinking your child might have cancer, it scares you half to death,” Tammy said. “So when we got the answers at UK, even though it was still a little scary, it was almost a relief. You hate for your baby to lose a part of them, but we were glad to know they could get rid of the tumor.”

Even though giant-cell tumors are not cancer, they are treated in much the same way. Nicole receives chemotherapy shots under the care of Lars M. Wagner, MD, a pediatric oncologist at UK HealthCare. The giant-cell tumors on her chest are shrinking, and Nicole will continue her follow-up appointments every month.

“Have never questioned anything they told me,” Nicole said of her team at UK HealthCare. “I wholeheartedly believed they knew what they were doing. And they obviously did because it’s working.”

‘Awesome’ doctors and nurses

Tammy said nurses and staff who have seen Nicole often come by during her follow-up visits to see how she’s doing.

“We have had awesome doctors and nurses,” Tammy said. “It’s like they’re family now. That’s how we think of them.”

The experience has led to a new career goal for Nicole. She hasn’t decided where to attend college, but she is thinking about majoring in psychology.

“When I get older, I would like to be able to counsel kids who are going through something like this too,” Nicole said. “I feel like I have learned enough that I could help them.”
